

CI/CD Superpowers

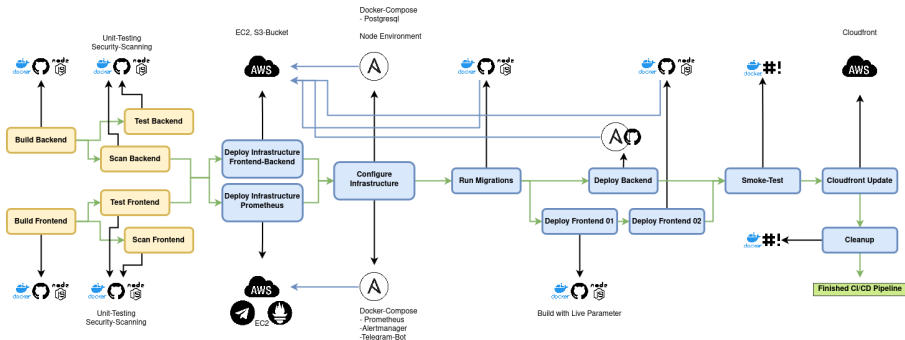

How CI/CD will give your Software Development Rocket Speed.

David Lassig

17th January 2021

Why do this?

On Error: Reverting Migrations, Rollback Configurations and Destroying Environments

Commit to Deploy

Git Repository as the Single Source of Trust:

- any new Commit can trigger complete Build-Chain
- depending on Branch only Software-Build/-Test or complete Deployment
- only successful Builds will be merged to master

✓ Everything under Control

Only Committed Code exists in Production. No lost/abandoned files. No missing Code.

Security and Resiliency by Design

Building and Pipelining Language specific Testing and Security Scanning Tools

- Run Unit Tests
- Audit Source and Third Party Dependencies
- Fix Vulnerabilities
- only Continue if Tests and Scans success

✓ Everything under Control

Any piece of Source Code will be tested and scanned. Third party imports will be tested and scanned. On every Commit.

Infrastructure under Version Control

Use Easy Mergeble Configuration Files like yaml or json:

- Hardware described in human readable and commitable files
- Easy Organisation of Engineering Teams by using Git Mechanics
- Only running Configurations get documented and into Master Repository

✓ Everything under Control

Easy Contribution of multiple Engineers. Changing configurations are 100% documented.

Measure Costs and Activities on Point

Cloudbased Applications are easily to monitor and provide very granular billing:

- Cloudbased Instances provide easy APIs for monitoring and alerting
- Costs are estimated by allocated Resources and only affects what you really used

✓ Everything under Control

Only successful Builds create Costs. All operation parameters are monitored. You will be alerted on exceptions.
